THE "AFTER - EIGHT" PET

Now that your pet is over eight years old, it becomes increasingly important to keep a check on health, because we know that kidney and liver function can deteriorate with advancing years.

Blood and urine tests enable us to detect early signs of organ dysfunction before your pet's quality of life deteriorates.

These samples can be taken at the surgery as part of our "Senior Pet Programme", and the results are available within 24 hours.

In this programme your pet will receive a full health check every six months and many aspects of healthcare together with your particular concerns will be addressed.

Don't forget an examination once a year for your pet is like you seeing your doctor only once in seven years!

Please feel free to discuss the benefits of this programme with any member of staff.
